Adolescence is an age of intensive change. In this period, adolescents experience great confusion in reaching his true identity. This period was characterized by growth, change, the emergence of a variety of occasions, and often face the risk of reproductive health. Every year around the world there are estimated four million teenagers have abortions, and almost 100 million infected Sexual Communicable Diseases could be cured. Teens often lack basic information about reproductive health, sexual negotiating skills, and access to affordable reproductive health services, and guarantee confidentiality. Concerns about the guarantee of confidentiality or the ability to pay, and the fact that sometimes the attitude of teenagers ATS incorrectly restrict access to further services. In addition there are also legal barriers associated with providing services and information to groups of teenagers. Many of the teenagers who lack or do not have a stable relationship with her parents and other adults with whom adolescents should be able to talk about reproductive health issues of concern or of concern to them. One part of these teenagers are a group of teenagers residing in the community of street children. Hard life on the streets with a less favorable situations, street children to survive, forcing them to become adults before their time. Although they are socially categorized as children, but almost all of them adopted a form of adult behavior as a sign of rebellion against some expectations that defined and determined by the local community. By using a form of adult behavior, they do not deserve the action that should be done in children at their own age, that is having pre-marital sexual relations, sexually transmitted diseases, drug use, homosexuality, and sexual violence. Easily acquire knowledge of sex shall affect the attitude towards street children in their sexual behavior (Nurharjadmo 1999). In the city of Malang, until now there are around 600 street children, mostly teenagers. Reproductive health issues is the most prominent issue at the moment. Results of medical examinations in early 2010 conducted on 150 street children in the city of Malang showed 100% undetected STD infection, and 12 of them were HIV positive indication. The low awareness and lack of knowledge of street children is one reason. There needs to be handling and care of all the parties to help alleviate this situation. This study aimed to identify the differences in attitudes about adolescent reproductive health risks before and after the given Module Training on Adolescent Reproductive Risks on street children, Institute for Child Empowerment of Griya Baca Malang. This study used a pre-experimental study, one
group pretest and posttest design. The samples taken were street children who are included in the Institute for Child Empowerment of Griya Baca Malang aged 11–21 years using the total population. Results of the analysis by using the Wilcoxon matched pairs test results is Asymp. Sig (2-tailed) or p-value < a, that is (0.000 < 0.05), so the hypothesis was accepted for there were differences between attitudes about adolescent reproductive health risks before and after the given Training Modules Adolescent Reproductive risk in children's Empowerment Institute of Street Children in Malang. This research might be the foundation in determining the targets of evaluation of health education on adolescent reproductive health by involving street children as a priority, especially in community nursing programs.

**Keywords:** attitude, street children, adolescent, the risk of reproductive health
